

Inventory Management System

Objectives

- Develop a web-based system for tracking product stock levels, procurement, and sales in real time.
- Automate stock alerts, purchase orders, and inventory reconciliation processes.
- Provide detailed reports to help businesses make data-driven supply chain decisions.

Deliverables

- A fully functional Inventory Management System.
- Product catalog with categories, SKUs, and stock levels.
- Stock-in and stock-out transaction recording.
- Low-stock alerts and automated reorder notifications.
- Comprehensive inventory and sales reports.

Requirements

- HTML: Structure product forms, inventory tables, and dashboards.
- CSS: Design a clean, data-focused business interface.
- JavaScript: Handle dynamic stock updates, chart rendering, and form logic.
- Backend: Manage product data, transactions, and report generation.
- Database: Store products, suppliers, transactions, and stock logs.

Advanced Features

- Barcode/QR Scanning: Scan items for fast stock entry and lookup.
- Multi-Warehouse Support: Track inventory across multiple locations.
- Supplier Management: Maintain supplier contacts and purchase order history.
- Expiry Tracking: Monitor perishable goods with expiry date alerts.
- Demand Forecasting: Predict future stock needs based on sales trends.
- Role-Based Access: Different access levels for managers, staff, and auditors.
- Batch & Serial Tracking: Track individual units or batches through the supply chain.
- Export Reports: Download inventory reports as PDF or Excel.

- Mobile Responsiveness: Accessible on tablets and handheld devices in warehouses.
- Integration Ready: API-ready for integration with POS and accounting software.
- Payment Gateway: Accept supplier payments and process purchase orders with Stripe integration.
- Customer Invoice Generation: Auto-create and email itemized invoices after order fulfillment.
- Payment Status Tracking: Track outstanding, paid, and overdue payments from the inventory dashboard.
